Revised 10-12-18

ULTRASOUND PROTOCOLS

Testicle/Scrotum Ultrasound Protocol Guideline

Indication	Torsion trauma, inflammation, mass, asymmetry, intrascrotal hernia, varicocele, nonpalpable testes, testicular pain
Prep	The patient should be in the supine position. Another towel is draped across the lower
	abdomen and is used to hold the penis to the abdomen and away from the scrotum. Apply
	ultrasound gel to the right scrotum and begin scanning in Transverse plane.
Procedure	1) In sagittal, along the anterior aspect of the scrotum, image the right testis including
	the mediastinum testis, measuring in long axis. Scan medial and lateral borders.
	2) In transverse, image the right testis at the mid-portion and measure in AP and
	transverse.
	3) Scan slightly anteriorly and image the superior portion of the testis.
	4) Scan back down to the mid-portion and angle slightly posteriorly to image the
	inferior portion of the testis.
	5) Place the transducer on the left scrotum and follow the same protocol as for the
	right scrotum.
	6) In transverse, place the transducer to the side of both scrotums, simultaneously and
	image both testes to compare relative echogenicity.
	7) In sagittal, image the right and left testis epididymis.
	8) Use Doppler to document intratesticular veins and arteries.
	a) Valsalva maneuver or upright positioning can be utilized to detect reflux (flow
	reversal for at least 2 seconds or increased amplitude).
	b) Include lower inguinal region and spermatic chord for extension of varicocele.
Evaluation Criteria	 Real-time evaluation and documentation should include but not be limited to: a) Size and Shape (approx.3x2.5 cm) b) Echogenicity c) Echo-texture (homogeneous/heterogeneous) d) Lesion (cystic or solid) i) Margins (thin, well defined /irregular, thick) ii) Shape (spherical, ovoid/ irregular, ill-defined borders) iii) Size iv) Location

ULTRASOUND PROTOCOLS

	v) Lobulations (>or<3)
	vi) Finger-like extensions
	vii) Enhanced through transmission (posterior enhancement)
	viii) Posterior attenuation
	e) Focal or diffuse enlargement of epididymis
	f) Fluid collection
2)	
,	a) Evaluating the presence or absence of blood flow:
	i) Internal in mass
	ii) External to mass
	iii) Laminar flow patterns
	iv) Normal vascularity
	v) Turbulence and mosaics
	b) Evaluating suspected infection
	c) Rule out torsion – color flow and doppler are mandatory to rule out torsion
	d) Assessment of resolution, persistence or recurrence of varicoceles
	ay Assessment of resolution, persistence of recurrence of variooceles

It is understood that other additional views, Doppler sampling sites, color settings, velocity ratios and measurements etc., will be used by the professional sonographer in evaluating any pathologic or suspected pathologic condition
